OxyChem is a leading manufacturer with facilities in the United States, Canada and Latin America. Headquartered in Dallas, OxyChem is a wholly owned subsidiary of Oxy, an international energy company. OxyChem has a top tier position both domestically and globally for all the products that it manufactures and markets.
Chlorine
Chlorine plays a role in more than 50 percent of all commercial chemistry. It is an essential building block for safe drinking water, waste water treatment, pharmaceuticals (including antibiotics, pain relievers, cancer treatments), medical equipment, plastics, dyes, cosmetics, construction materials, shatter-resistant glasses, bulletproof vests, electronics, adhesives, automobile parts (including seat belts) and sports equipment.

Sodium Hydroxide
Commonly known as caustic soda, sodium hydroxide is coproduced with chlorine and has a wide variety of applications in many industries, including water treatment, pulp and paper, aluminum, soaps and detergents, textiles, petrochemicals and chemical processing. Caustic soda is also used in the production of bleach, food processing, battery recycling, pharmaceuticals, drilling muds, petroleum refining and agricultural chemicals.

Potassium Hydroxide
Potassium hydroxide (KOH), or caustic potash, is used by the soap and detergent, fertilizer and chemical industries. Other uses for caustic potash are molten salts, dyes, pharmaceuticals, photographic chemicals and batteries. KOH is essential for the efficient growth of crops both domestically and globally to provide high volumes of necessary agricultural products.

Calcium Chloride
Calcium chloride is largely used to control snow and ice on sidewalks, parking lots and roads; to suppress dust on unpaved surfaces; and for road stabilization. Its use has been extended through a variety of innovative applications in oil field operations, industrial processing, agriculture, water treatment, refrigeration systems and tire weighting. Calcium chloride is also a key component in many food-grade applications.

Vinyl Chloride Monomer
Vinyl chloride monomer (VCM) is the key chemical precursor to polyvinyl chloride (PVC). VCM is produced by chemically reacting chlorine and ethylene which produces Ethylene Dichloride (EDC) and subsequently exposing the EDC to high temperatures which produces the essential VCM.

Polyvinyl Chloride
OxyChem offers a full product line of polyvinyl chloride (PVC) resins, utilizing VCM as a feedstock suitable for most vinyl applications. PVC is widely used in medical applications, piping systems, siding, irrigation and sewer systems, electrical conduits, window frames, water distribution systems, wire and cable insulation, flooring and wallcoverings, fencing, gutters and downspouts, landfill liners and fire-sprinkler piping.

Chlorinated Organics
OxyChem’s chlorinated organics are used as chemical feedstock and intermediates in the manufacturing of silicones, agricultural chemicals, refrigerants, quaternary ammonium compounds and pharmaceuticals. Other applications include metal and electronics cleaning, paint stripping, flexible foam manufacturing and catalyst regeneration.

Silicates
Sodium silicate is the generic name for a series of compounds derived from soluble products produced from sand, soda ash and caustic soda. They serve a wide range of end-use markets, including thermal and acoustical insulation, ceramics, soaps and detergents, paper products, paint and pigments and water treatment.

ACL® Chlorinated Isocyanurates
Chlorinated isocyanurates are leading dry sanitizers used for residential swimming pools and spas, effectively eliminating germs and algae. Their disinfection properties make them an important component of disinfecting materials, dishwashing detergents and industrial water treatment products. OxyChem’s chlorinated isocyanurates are also approved for routine potable water chlorination.
